

Chebet Family Enterprises — Farm-to-Market Entry Plan

A working instruction sequence for Grace Chebet (the farm) and her daughter-in-law (the market stall), selling vegetables, fruit, eggs, and spices from a family farm in Naivasha to a grocer stall at the local market.

The honest economics, stated upfront

This is a **vertically integrated** family enterprise: the farm grows produce, the market stall sells it. The produce transfers from farm to stall at cost (no internal markup — it is the same family, the same business). The stall's margin is the difference between the growing cost and the market price. The farm's economics are: seasonal planting costs up front, months of growing with no income, then a harvest that fills the stall for weeks.

FARM unit — Grace's domain. Planting, growing, harvest, livestock (layers for eggs, dairy cow for milk). Costs: seeds, fertiliser, seasonal labour during planting, extra security during harvest (theft is a real risk at harvest time in Naivasha), vet and feed for the cow and layers.

SHOP unit — the daughter-in-law's domain. The market grocer stall where produce is sold retail: sukuma wiki, cabbage, bananas, oranges, rosemary, parsley, garlic, eggs (when available), milk. Also buys some items wholesale from other farms when the Chebet farm's own harvest doesn't cover demand (oranges, bananas, garlic — items the farm doesn't grow year-round).

The business makes money when the stall's retail margin exceeds the farm's growing costs. Seasonality is the real challenge: planting months have heavy costs (labour, seeds, fertiliser) with no harvest income; harvest months have almost no growing costs but need security labour. Between harvests the stall buys wholesale to stay open.

Family roles

Person	Unit	Role	Access	Notes
Daniel Chebet	Both	Owner	OWNER_FULL	Provides capital, makes major decisions, is away frequently
Grace Chebet	FARM	Co-owner, farm manager	MANAGER	Day-to-day farm operations, decides what to plant
Daughter-in-law	SHOP	Stall manager, 50/50 profit share	MANAGER	Runs the market stall, supervises employees, operational successor
Niece	Both	Accountant/advisor	ACCOUNTANT	Reviews the books, prepares figures for the bank
Grandson	Viewer	Future successor	VIEWER	Learning the business, no operational role yet
Son	—	Estranged	EXCLUDED	No operational involvement, no succession rights

The succession plan: Grace and Daniel will hand the **entire enterprise** to the daughter-in-law. She already operates both units in practice. The grandson will eventually inherit but is not yet ready.

Products — what the farm grows vs what the stall sells

Farm-grown products (FARM unit, transferred to SHOP at cost)

Product	Category	Season	Farm cost (est.)	Stall price
Sukuma Wiki (bunch)	Vegetable	Year-round (irrigated)	KES 10	KES 20
Cabbage (head)	Vegetable	Main season (Mar–Jul)	KES 25	KES 50
Rosemary (bunch)	Spice/Herb	Year-round (perennial)	KES 5	KES 20
Parsley (bunch)	Spice/Herb	Year-round (irrigated)	KES 8	KES 15
Eggs (each)	Poultry	When available (layers)	KES 10	KES 15
Fresh Milk (1L)	Dairy	Daily (1 cow)	KES 55	KES 80

Wholesale-bought products (SHOP unit, bought from other farms)

Product	Buy price	Sell price	Notes
Bananas (hand)	KES 60	KES 100	Bought from Kisii/Meru farmers at Naivasha market
Oranges (each)	KES 10	KES 20	Seasonal from coastal farms
Garlic (bulb)	KES 30	KES 50	Imported or from Meru, availability varies

Step 1 — Business setup

1. Sign up: "Chebet Family Enterprises", Industry = Agriculture, Kenya, KES.
2. Business Units: FARM and SHOP.

Step 2 — Open backdated trading days

Settings → Periods. Open each day in your two-month window, date order.

Step 3 — Opening capital (unit: FARM)

Money → Funds → Owner Capital Injection, Day 1:

Amount	Account	Note
KES 30,000	Bank	"Opening savings — farm operations"
KES 10,000	Mobile Money	"M-Pesa float — paying casual workers, buying seeds"
KES 5,000	Cash / Till	"Petty cash — market transport, small purchases"

Total: **KES 45,000** into FARM.

No inter-unit transfer at setup. The stall starts earning from Day 1 (selling whatever produce is ready). Revenue builds up in SHOP naturally.

Step 4 — Products

Unit: **FARM** — Products page:

Product	Type	Price	Cost
Sukuma Wiki (bunch)	Goods	KES 20	KES 10
Cabbage (head)	Goods	KES 50	KES 25
Rosemary (bunch)	Goods	KES 20	KES 5
Parsley (bunch)	Goods	KES 15	KES 8
Eggs (each)	Goods	KES 15	KES 10
Fresh Milk (1L)	Goods	KES 80	KES 55

Also create under FARM — for the biological asset register:

Product	Type	Notes
Layer Chicken	Goods	For tracking individual layers in the register
Dairy Cow	Goods	The single cow supplying milk

Unit: **SHOP** — Products page:

Product	Type	Price	Cost
Bananas (hand)	Goods	KES 100	KES 60
Oranges (each)	Goods	KES 20	KES 10
Garlic (bulb)	Goods	KES 50	KES 30

The farm-grown products (sukuma, cabbage, herbs, eggs, milk) also need to exist in SHOP's product list at the same prices — they're the same products, just sold from a different unit. When the stall sells sukuma that came from the farm, the sale posts against SHOP's copy of the product.

Step 5 — Register livestock (unit: FARM)

The dairy cow

Organisation → Livestock → Register Animal:

- Tag: COW-001
- Product: Dairy Cow
- Sex: FEMALE
- Fair value: KES 65,000 (market value for a lactating Friesian cross)
- Condition: GOOD

The layers

Register each individually if the flock is small (under 20), or use **bulk registration** for a larger flock:

For individual layers:

- Tags: HEN-001 through HEN-012 (or however many)
- Product: Layer Chicken
- Sex: FEMALE
- Fair value: KES 800–1,200 per bird (market value for a laying hen)

For a larger flock: `POST /api/livestock/bulk-planting` with:

- `productId`: Layer Chicken
- `fieldId`: "FLOCK-A"
- `plotCount`: 30 (number of birds)
- `fairValuePerPlot`: 1000

Note: `bulkPlanting` works for any batch of biological assets that share metadata — it's not limited to crops.

Step 6 — Planting the farm (unit: FARM)

Sukuma wiki and herbs (year-round)

Sukuma wiki grows in 6-week cycles under irrigation. Register a planting via bulk planting:

`POST /api/livestock/bulk-planting`:

- `productId`: Sukuma Wiki
- `fieldId`: "SUKUMA-PLOT-A"

- plotCount: 8 (number of beds/rows)
- plantingDate: the actual planting date
- fairValuePerPlot: KES 200 (estimated value of one bed at maturity)
- growthStage: PLANTED

Rosemary and parsley are perennials — register once:

- Organisation → Livestock → Register Animal (category: CROP)
- Tags: ROSEMARY-BED-1, PARSLEY-BED-1
- Fair value: KES 500 per bed (they produce continuously)

Cabbage (seasonal, main season)

Bulk planting during March–April:

- fieldId: "CABBAGE-FIELD-B"
- plotCount: 20
- fairValuePerPlot: KES 100 (value increases as cabbage matures)

Seasonal labour during planting (unit: FARM)

POST /api/seasonal-labour:

- description: "Planting sukuma wiki — bed preparation and transplanting"
- days: 3
- dailyRate: KES 500
- labourType: FARM_LABOUR
- paymentMethod: CASH

Repeat for each crop and each planting cycle. A typical planting month might need 3–4 workers for 3–5 days each = **KES 4,500–10,000/month** in casual labour during planting.

Step 7 — Harvest and transfer to stall

Harvesting crops (unit: FARM)

When sukuma wiki is ready (6 weeks after planting): Organisation → Livestock → Record Harvest:

- plantingResourcesId: the planting's Resources_id
- outputProductId: Sukuma Wiki (the sellable product)
- outputQuantity: 40 bunches (from one bed)
- harvestValue: KES 400 (40 × KES 10 cost)

This moves the value from Biological Assets to Inventory on FARM.

Seasonal labour during harvest — including security

POST /api/seasonal-labour:

- description: "Cabbage harvest — cutting and loading"
- days: 4, dailyRate: KES 500, labourType: HARVEST

And separately for security:

- description: "Night security during cabbage harvest"
- days: 7, dailyRate: KES 800, labourType: SECURITY

The security line is deliberately distinct from farm labour on the P&L so the accountant can see the theft-mitigation cost separately. In Naivasha, harvest theft is a known, predictable risk — budgeting for security is not paranoia, it's realistic accounting.

Transferring produce to the stall

The farm "sells" produce to the stall at **cost** (no markup). This is an internal transfer, not a real sale — the same family, the same money.

FARM side: Till → Sell, 40 bunches Sukuma Wiki @ KES 10 (cost price). Revenue: KES 400. Posted to FARM.

SHOP side: Till → Buy, 40 bunches Sukuma Wiki @ KES 10. Inventory increases. Posted to SHOP.

The FARM records a "sale" at cost = zero margin. The real margin appears only when SHOP sells to a customer at KES 20/bunch. This is the honest accounting: the farm is a cost centre, the stall is the profit centre, and the transfer price is transparent.

For items the stall **buys wholesale** from other farms (bananas, oranges, garlic): post directly to SHOP via Till → Buy at the wholesale price.

Step 8 — Daily stall operations (unit: SHOP)

Morning: receive produce from the farm

Till → Buy at cost price for whatever the daughter-in-law takes to market that morning. Typical daily basket from the farm:

Item	Qty	Cost	Total
Sukuma Wiki	20 bunches	KES 10	KES 200
Cabbage	3 heads	KES 25	KES 75
Rosemary	5 bunches	KES 5	KES 25
Parsley	5 bunches	KES 8	KES 40
Eggs	12	KES 10	KES 120
Milk	5 litres	KES 55	KES 275
Farm produce total			KES 735

Plus wholesale purchases (when in stock):

Item	Qty	Cost	Total
Bananas	5 hands	KES 60	KES 300
Oranges	20	KES 10	KES 200
Garlic	5 bulbs	KES 30	KES 150
Wholesale total			KES 650

All day: sell to customers

Till → Sell for each customer, at retail price. Typical daily sales:

Item	Qty	Price	Revenue
Sukuma Wiki	18 bunches	KES 20	KES 360
Cabbage	3 heads	KES 50	KES 150
Rosemary	4 bunches	KES 20	KES 80
Parsley	4 bunches	KES 15	KES 60
Eggs	10	KES 15	KES 150
Milk	4 litres	KES 80	KES 320
Bananas	4 hands	KES 100	KES 400
Oranges	15	KES 20	KES 300
Garlic	3 bulbs	KES 50	KES 150
Daily stall revenue			~KES 1,970
Daily stall cost			~KES 1,385
Daily gross margin			~KES 585

Some items don't sell every day — eggs and garlic are "when available." Vary the quantities for realism. Unsold perishables (sukuma, parsley) are a real spoilage cost tracked through inventory write-down if they wilt overnight.

Daughter-in-law's share

Her arrangement is 50/50 profit share on produce she manages. Her share is computed monthly: (SHOP net profit) × 50%. This is a management/payroll event, posted as:

Claims → Expenses → Salaries (or Other): Amount: 50% of SHOP's monthly net Note: "Daughter-in-law profit share — [month], 50% of KES [net]"

Step 9 — Farm running costs (unit: FARM)

Seeds and seedlings (seasonal)

Claims → Expenses → Other:

- KES 2,000 — "Sukuma wiki seedlings — 200 seedlings for SUKUMA-PLOT-A"
- KES 3,000 — "Cabbage seedlings — 300 seedlings for CABBAGE-FIELD-B"
- KES 500 — "Parsley seed packet"

Fertiliser and pesticides

Claims → Expenses → Other:

- KES 1,500/month — "DAP fertiliser — half bag for sukuma and cabbage"
- KES 800/month — "Pesticide spray — cabbage and sukuma"

Chicken feed and dairy cow feed

Claims → Expenses → Other:

- KES 3,000/month — "Layer mash — 30 birds × KES 100/month feed"
- KES 2,000/month — "Dairy meal — 1 cow, supplementary feeding"

Vet costs (provision route)

Same as Maasai v4: provision KES 5,000 for routine vet care. Utilise on actual vet visit.

Step 10 — Spoilage and wastage

Perishable produce that wilts, rots, or is damaged is a real cost. Two mechanisms:

Inventory write-down (SHOP): when sukuma or parsley wilts unsold overnight, it's a loss. Post via Till → Sell at KES 0 (zero price, full quantity), which records the COGS write-off without any revenue. Or use the Record Loss route on the Resources row.

Spoilage during repackaging (FARM): if eggs break during transport or milk sours before reaching the stall, use the spoilage parameter in postRepackaging or record as Expenses → Other.

Sanity-check totals

SHOP — monthly (the stall)

Item	Amount
Daily sales (~KES 1,970 × 26 market days)	+51,220
Daily cost of goods (~KES 1,385 × 26)	−36,010
Gross margin	+15,210
Daughter-in-law profit share (50%)	−7,605
Stall rent / market fees (if any)	−2,000
Transport farm → market	−1,500
Spoilage (est. 5% of perishables)	−1,800
SHOP net	~+2,305

FARM — monthly

Item	Amount
Internal "sales" to SHOP (at cost)	~19,000
Less: cost of production	
Seeds/seedlings (amortised monthly)	−2,000
Fertiliser + pesticides	−2,300
Chicken feed	−3,000
Dairy cow feed	−2,000
Casual labour (planting months, amortised)	−3,000
Security (harvest months, amortised)	−2,000
Vet provision	−1,500
FARM net	~+3,200

Combined — the accountant's view

Line	Amount
SHOP net	+2,305
FARM net	+3,200
Combined monthly net	~+5,505

This is a genuine small-scale family enterprise: modest but positive margins, heavily dependent on the daughter-in-law's labour (her profit share is the single largest cost after goods), and vulnerable to seasonal gaps and spoilage.

The balance sheet tells the other story: the dairy cow (KES 65,000), the layer flock (KES 30,000), any standing crops (valued through monthly reviews), and the stall's inventory are real assets. If Daniel applied for a SACCO loan against these, the accountant can show genuine collateral.

The succession path

When Daniel and Grace decide to hand over:

POST /api/succession:

- outgoingManagementId: Daniel's Management ID
- incomingManagementId: daughter-in-law's Management ID
- reason: "Retirement. The daughter-in-law has managed both the farm and the stall for [X] years. Grace continues to advise on planting decisions. The grandson will take over when ready."

This:

- Posts the equity transfer (Daniel's capital → daughter-in-law)
- Updates Daniel to RETIRED/VIEWER
- Updates daughter-in-law to CURRENT_OWNER/OWNER_FULL
- Writes a Knowledge entry recording the decision and reasoning

Grace's second succession can happen later when she's ready — a separate postSuccession call for her share. The system supports sequential handovers.

What each view shows

The daughter-in-law (SHOP manager)

SHOP P&L: daily sales, cost of goods, her profit share as a line item. She sees what the stall makes and what she earns. She doesn't need to see the farm's growing costs — that is Grace's domain.

Grace (FARM manager)

FARM P&L: growing costs (seeds, fertiliser, labour, feed, vet), the internal "sales" to SHOP at cost. She sees whether the farm covers its own costs. She doesn't need to see the stall's retail margin.

The niece (Accountant)

Combined Journal, Trial Balance, Balance Sheet. The full picture: farm growing costs + stall margins + livestock assets + the inter-unit transfer at cost. She prepares the figures Daniel takes to the bank.

Daniel (Owner)

Sees everything, but what matters to him: the combined net figure, the balance sheet total (his wealth), and the Knowledge page where the succession reasoning is recorded for his grandson to read someday.

Biological asset lifecycle — what grows on this farm

Stage	Crops	Livestock
Acquisition	Buy seeds/seedlings (Expense) → bulk planting (register)	Buy day-old chicks or heifer (Asset Purchase) → register
Growth	Monthly review: update growth stage, fair value	Monthly review: update condition, egg count
Production	Harvest → inventory (sukuma, cabbage, herbs)	Daily: collect eggs and milk (sell via SHOP)
Maturity	Harvest complete; replant (new cycle)	Layers produce ~18 months; cow produces years
End of life	Crop residue — no value (compost)	Spent layer sold (KES 300–500); cow sold or replaced
Appreciation	Dry grain stored for off-season premium	Breeding cow's calf is a new asset (recordBirth)
Depreciation	Wilted produce (spoilage)	Aging layer's production drops (fair value review)

What this plan cannot yet do

- **Formal payroll** for the daughter-in-law: her profit share is posted as an expense, not through a payroll register with PAYE.
- **Automated inter-unit transfer**: the farm-to-stall transfer is two manual Till entries (sell from FARM, buy into SHOP). A single "transfer produce" feature would reduce this to one step.
- **Spoilage tracking per product**: the platform tracks inventory quantities but does not yet flag items nearing expiry automatically. Spoilage is posted manually when produce wilts.
- **Seasonal cash flow forecasting**: the accountant can see historical patterns but cannot model "if we plant cabbage in March, when does the harvest income arrive?" This is a reporting gap, not a posting gap.
